THE GENUS ITHOME IN NORTH AMERICA NORTH OF MEXICO (WALSHIIDÆ)

by Ronald W. Hodges

Several factors have combined to create confusion concerning the generic names Ithome and Eriphia. Each was proposed with one included species, Ithome unimaculella and Eriphia concolorella, Later, Chambers (1878) described albalineella and nigrilineella and placed them with reservation in Eriphia; and in 1879 he stated that unimaculella was congeneric, not conspecific, with Perimede erransella Chambers. RILEY (1891) incorrectly interpreted Chambers' statement unimaculella with the result that he treated unimaculella a synonym of P. erransella. Barnes and McDunnough (1917) indicated that Eriphia Chambers was preoccupied, and they placed it as a synonym of Ithome; however, they cited unimaculella as a synonym of P. erransella. It is difficult to understand their *lapsus* in removing the type of *Ithome* from the genus. Braun (1919) cleared up this supposed synonymy by indicating the characters of each genus, Ithome and Perimede, and by pointing out that Chambers had said that the two species were congeneric, not conspecific. Also, though not stated, she inferred that unimaculella and concolorella are congeneric. Forbes (1923) concurred with Barnes and McDunnough that Ithome is the valid name, even though it is a junior synonym of Eriphia, because Eriphia is a junior homonym; and he included unimaculella in Ithome; however, in 1931 he reversed his position, without giving an explanation, and used Eriphia as the valid name.

Braun (1923) placed albalineella in Tanygona, leaving three species, concolorella, nigrilineella, and unimaculella, in Ithome; and McDunnough (1939) followed this arrangement. Forbes (1931) said that concolorella and unimaculella are conspecific. I have examined Chambers' specimens

of concolorella and unimaculella and confirm his statement that they are conspecific. E. nigrilineella has been removed (Hodges, in press) to a new genus in the Cosmopterigidæ. In this paper I. quinquepunctata (Forbes) is recorded from Florida, and three new species are described, bringing the number of species of Ithome for our fauna to five.

An additional point should be mentioned: Forbes (1931) stated that *Eritarbes* Walsingham is a synonym of *Eriphia*. The venation of *Eritarbes* is close to that of *Ithome* but not close enough to warrant the synonymy without study of the male and female genitalia.

The known larvæ of species of *Ithome* feed on the flowers of members of the Leguminosæ and Polygonaceæ. Namba (1956) illustrated the larva and pupa and presented the life history of *I. concolorella*, which has probably been introduced into the Hawaiian Islands.

A full definition of the Walshiidæ will appear later (Hodges, in press). The genera of Walshiidæ occurring in the United States and Canada are Walshia, Stilbosis, Ææa, Chrysopelia, Ithome, Perimede, Periploca, Amaurogramma, and Sorhagenia.

I wish to thank the following persons and institutions for allowing me to study specimens under their care (the letters in brackets are used to designate the present location of specimens): Dr. Annette F. Braun [AFB]; Mr. M. O. Glenn [MOG]; Mr. C. P. Kimball [CPK]; Dr. A. B. Klots [ABK]; Dr. P. J. Darlington, Jr., Museum of Comparative Zoology [MCZ]; and Dr. J. F. G. Clarke, United States National Museum [USNM]. Specimens in the Cornell University Collection are indicated by [CU] and those in my collection by [RWH].

Ithome Chambers (Fig. 1)

Type: (unimaculella Chambers, 1875) = concolorella Chambers, 1875. Monotypic.

Kearfott, in Smith, 1903, Check list of the Lepidoptera of Boreal America: 118. Barnes & McDunnough, 1917, Check list of the Lepidoptera of North America: 152 (as synonym of Ithome). Braun, 1919, Ent. news 30: 263 (as synonym of Ithome?). Forbes, 1923, Mem. Cornell univ. agric. exp. sta. 68: 329 (as synonym of Ithome). Fletcher, 1929, Mem. dept. agric. India, ent. ser. 11: 85 (as synonym of Mompha). Forbes, 1931, Jour. dept. agric. Porto Rico 4: 358. McDunnough, 1939, Mem. so. California acad. sci. 2: 63 (as synonym of Ithome).

Description: Head smooth-scaled; tongue moderate in length, scaled; maxillary palpus short, folded over base of tongue; labial palpus recurved, reaching beyond vertex, second segment longer than third, third segment smooth-scaled or slightly rough-scaled; antenna two-thirds length of forewing, pecten of one seta present, scape twice as long as wide, simple; ocelli visible. Metathoracic tibia with long dorsal scales. Forewing: lanceolate, apex acute; 12 veins present; lb furcate basally; 2 from before end of cell, weak basally, curved dorsally then running parallel with 3; 3 and 4 distant basally; 6, 7, and 8 stalked; 10 opposite 2; 11 from one-half of cell. Hindwing: linear, apex acute; a series of scales on costal margin at one-fourth; lb simple, weak; 3 and 4 distant; 4 and 5 connate; 6 and 7 stalked to five-sixths. Male genitalia: valvæ symmetrical or asymmetrical; processes arising from base of valvæ or absent; vinculum with narrow dorsal arms; ædeagus ankylosed; tegumen narrow, an irregular sclerotized band connecting pedunculi; subscaphium a narrow sclerotized band; uncus present; gnathos and socii absent. Female genitalia: bursa copulatrix lightly sclerotized; signa two or absent; ductus bursæ membranous; apophyses anteriores and posteriores heavily sclerotized.

Ithome is a tropical American genus which has few representatives in the United States, and of these only concolorella is known to occur as far north as Ohio. The other species are recorded from Texas to Florida along the Gulf of Mexico.

KEY TO SPECIES OF Ithome BASED UPON MACULATION

towns buff white been functions

1.	Shaft of antenna concolorous
2.	Scales of vertex and occiput of head concolorous
	Scales of vertex and occiput pale distally
3.	A costal and a dorsal buff-white spot at three-fourths on forewing
	A costal buff-white spot at three-fourths on forewings; dorsal spot, if present, at two-thirds ferax Hodges
4.	Most scales of vertex pale-tipped lassula Hodges Few scales of vertex pale-tipped; vertex sometimes buff

Eriphia unimaculella, Forbes, 1931, Jour. dept. agric. Porto Rico 4: 359 (as synonym of concolorella).

Fig.12. Habitus of Ithome concolorella (Chambers).

Description: Tongue fuscous-buff basally, ochreous distally. Maxillary palpus fuscous-buff. Labial palpus dark fuscous, base and apex of third segment buff-white, three to five buff-white dots on anterior surface of third segment. Face fuscous on lower third, buff-white on upper two-thirds and on anterior part of vertex, a few fuscous-black scales before each eye; posterior portion of vertex and all of occiput fuscous-black. Antenna fuscous-black, apical ten to twelve segments buff-white. Thorax fuscous-black. Legs fuscous on outer surface, buff to fuscous-buff on inner surface; metathoracic tibia with a buff-white annulation at middle and apex, outer tibial spurs shining buff-white in some lights; apices of first four segments and all of fifth segment of metathoracic tarsus buff-white. Forewing fuscous-black, a buffwhite spot on costal and dorsal margins at three-fourths distance from base to apex of wing, a buff-white spot on fold at one-third distance from base to apex of wing; cilia concolorous with wing apically, pale fuscous-buff dorsally. Hindwings fuscous, cilia pale fuscous. Abdomen fuscous in male, last segment ochreous; fuscous-buff in female. Male genitalia: as in figure 2 (R. W. H. slide 878). Female genitalia: as in figure 7 (J. F. G. Clarke slide 10495). Alar expanse: 5-7 mm.

Food plant: Prosopis chilensis (Mol.) Stuntz and Acacia farnesiana (L.) in the Hawaiian Islands, no hosts recorded for the continental United States.

Types: Of concolorella, LECTOTYPE, PRESENT DESIGNATION, male, bearing following labels: 1) Type, 1356. 2) Tex. 3) Chambers. 4) 98. 5) male Genitalia Slide 875, Ronald W. Hodges. Ithome quinquepunctata (Forbes), NEW COMBINATION (Figs. 6, 8)

Eriphia quinquepunctata Forbes, 1931, Jour. dept. agric. Porto Rico 4: 361.

Description: Maculation as for concolorella except as follows: upper part of face pale fuscous; apex of scape of antenna buff, shaft gray-buff. Male genitalia: as in figure 6 (R. W. H. slide 656). Female genitalia: as in figure 8 (R.W.H. slide 657). Alar expanse: 6-7 mm.

Food plant: Coccoloba uvifera (L.) Jacq.

Type: in Cornell University Collection.

Type locality: Puerto Real, Vieques Is., Puerto Rico.

Specimens examined: FLORIDA: $6 \circlearrowleft \circlearrowleft, 4 \circlearrowleft \circlearrowleft$, Ramrod Key, reared ex Coccoloba uvifera, emerged March 3 & April 6, 1945 [USNM]; $16 \circlearrowleft \circlearrowleft$, $12 \circlearrowleft \circlearrowleft$, Siesta Key, Sarasota Co., January 3-December 20, 1951-1957 (C. P. KIMBALL), [CPK, RWH].

ITHOME EDAX Hodges, NEW SPECIES (Figs. 5, 11)

Description: Maculation as for concolorella except as follows: occiput sometimes buff-white with fuscous scales above each eye, and some scales of vertex and occiput pale-tipped. Male genitalia: as in figure 5 (R.W.H. slide 10013). Female genitalia: as in figure 11 (R. W. H. slide 10015). Alar expanse: 6-7 mm.

Food plants: Byra ebenus (?).

HOLOTYPE: male, Brownsville, Texas, ex Ebony blossoms (Byra ebenus?), emerged June 7, 1944 (R.W.H. slide 10013), [USNM].

PARATYPES: TEXAS: $3 \circlearrowleft \circlearrowleft$, $11 \circlearrowleft \circlearrowleft$, same data as holotype [USNM, RWH]; $9 \circlearrowleft \circlearrowleft$, $4 \circlearrowleft \circlearrowleft$, Corpus Christi, May 8 & 14, 1943 (W. M. Gordon), [CU, RWH].

I. edax may be separated from I. lassula as follows: the dorsal accesory process of the right valva passes over the ædeagus in edax; in lassula the same process is parallel with the ventral one and does not pass over the ædeagus. The ædeagus of edax tapers gradually to the apex, whereas in lassula it is broad almost to the apex. In the female genitalia edax has no signa; lassula has two signa.

ITHOME LASSULA Hodges, NEW SPECIES (Figs. 3, 10)

Description: Maculation as for concolorella except as follows: third segment of labial palpus slightly rough-scaled; head fuscous, apices of scales on vertex and occiput gray-buff; apex of scape of antenna buff; forewing with dorsal buff-white spot anterior to costal one or obsent; abdomen fuscous with purple reflections. Male genitalia: as in figure 3 (R.W.H. slide 10021). Female genitalia: as in figure 10 (R.W.H. slide 10023). Alar expanse: 6-8 mm.

Food plant: Leucæna glauca (L.) Bentham.

HOLOTYPE: male, Key West, Florida, ex flowers of Leucæna glauca, emerged April 19, 1945 (R.W.H. slide 10021), [USNM].

PARATYPES: FLORIDA: $5 \circlearrowleft \circlearrowleft, 10 \circlearrowleft \circlearrowleft$, same locality as holotype, emerged March 16-April 17, 1945 [USNM, RWH]; $1 \circlearrowleft$, Homestead, March 31, 1959 (D. O. WOLFENBARGER), [CPK].

I. lassula may be separated from I. edax as indicated under edax.

ITHOME FERAX Hodges, NEW SPECIES (Figs. 4, 9)

Description: Maculation as for concolorella except as follows: face fuscous-buff; forewing with dorsal buff-white spot, if present, anterior to costal one; abdomen fuscous, last segment ochreous. Male genitalia: as in figure 4 (R.W.H. slide 637). Female genitalia: as in figure 9 (R.W.H. slide 638). Alar expanse: 7-10 mm.

Food plant: unknown.

HOLOTYPE: male, Siesta Key, Sarasota County, Florida, February 29, 1960 (C. P. Kimball), [Cornell University Type No. 3828].

PARATYPES: FLORIDA: 5 \$\displaystyle \displaystyle \displaystyle \text{q}\$, same locality as holotype, January 4-April 12, 1960 (C. P. Kimball), [CPK, RWH]; 2 \$\displaystyle \displaystyle \displayst

I. ferax may be distinguished from I. concolorella by the valvæ of the male genitalia being symmetrical; in concolorella the valvæ are asymmetrical. In the female genitalia the lamella antevaginalis is present in ferax; it is absent in concolorella.

The illustration of the female genitalia (Fig. 9) would lead one to believe that a difference exists between *ferax* and the other species of *Ithome* because the genitalia are fully extended. It is almost impossible to obtain a preparation of this nature because the orifice at the posterior extremity of the eighth abdominal segment is small and does not allow the other segments to pass. It seems to me, however, that the normal, extended position of all five of the species is much the same as is shown for *ferax*.

ACKNOWLEDGEMENTS

Grateful acknowledgement is made to the Grace H. Griswold Fund of the Department of Entomology of Cornell University for assuming the cost of engraving.

The specimens of *I. concolorella* from Highlands, North Carolina, were collected during the summer of 1958 when the author was assisting Dr. J. G. Franclemont. The collecting was done under the auspices of a grant from the Penrose Fund of the American Philosophical Society.
